

*Draft*  
**Digital Health  
Investment Taxonomy**

*Standardised Digital Health Transformation  
and AI Investment Classification System*

**Public Consultation Period**

 **7 April to 10 June 2026**

Digital health investment is growing. The challenge is ensuring these resources are directed strategically, aligned with national strategies, coordinated across stakeholders, and tracked in ways that enable transparency, accountability and learning. Without a shared classification system for investments across the various funders in the digital health and AI ecosystem - including governments, development partners, donors and private sector - this is difficult; investments remain invisible, gaps go unidentified, fragmentation and duplication persist, and accountability is hard to maintain.

**This Digital Health Investment Taxonomy is being developed to provide a common framework for categorising and tracking digital health investments across stakeholders and funding sources.** It is designed to strengthen budgeting, planning, and coordination; enable development partners and private sector actors to better align their portfolios and coordinate efforts; and for standardised reporting within existing financial tracking and monitoring frameworks.

This work is being led by Transform Health, with guidance and inputs from a leadership steering committee including: Global Fund, OECD, UNICEF, WHO, and World Bank. It has been developed through an extensive landscape scoping review and expert and stakeholder guidance. The Taxonomy responds to calls from G20 Health Ministers in 2024 for improved tracking of digital health investments and the 2024 G20 Health Working Group, where key digital health partners committed to collaborate to develop tools to improve tracking of digital health funding.

We are now launching a **public consultation period on the draft Taxonomy from 7 April to 10 June**, to gather wide stakeholder feedback on the structure, content, and usability of the taxonomy, and to build consensus to support better classification and tracking of investment.
